DESCRIPTION

The ODS-3000 consists of single-phase sine-wave DC/AC inverters with galvanic isolation between input and output

The unit allows:

- Select 50 / 60Hz by means of DIP-switch.
- Select local / remote (RS-232) by means of DIP-switch
- Shutdown applying voltage on pins 3 and 4 of signal connector
- Local signalization of Output OK by means of green LED
- Local alarm. Red LED ON when:
 - Output voltage is not OK
 - Output current > OUTPUT CURRENT ALARM
 - Input voltage out of margins
 - Unit shutdowns by over-current or remote OFF
 - Internal temperature > Internal warning temp.
- Alarm. Open contacts when output voltage is not OK
- Set and monitor parameters via RS-232.

The ODS-3000 are equipped with a maximum average power protection as well as maximum output peak current protection. This protects the unit even when an output short-circuit occurs. It also features a disabled function for input under-voltage, which allows protecting the batteries from harmful discharges.

START-UP

- The unit has 6 threaded holes for the fixation on a mounting surface.
- The unit has internal fans. For an appropriate cooling, the air input and output should be free of elements that cause and an air flow reduction (minimum recommended distance to other objects 50mm).
- Make connections as shown in the figure.
- The default output frequency is 50Hz. For 60Hz simply actuate the dip-switch as indicated in the figure.

For safety reasons, the following requirements must be met:

- Provide the equipment with some kind of protective enclosure that complies with the electrical safety directives in effect within the country where the equipment is installed.
- Include a time lag input fuse or current breaker curve D with a rating immediately higher than the maximum input current.
- As per the input and output currents indicated in the table on page 3, choose the appropriate cable cross-section according to the maximum rated current indicated in the following table:

Max. Current [A]	16	25	32	40	63	80	100	125	160	190
section [mm ²]	1.5	2.5	4	6	10	16	25	35	50	70

RS232 Functions	Monitor	Set
	Input voltage	Input under-voltage lockout
	Output voltage	Input under-voltage alarm
	Output current	ON / OFF
	Internal temperature	Output frequency
	Output frequency	Maximum output current
	Output power	Output voltage

RS232 communication port

It is possible to control and monitor the unit via RS232 by means of a terminal emulator like "Tera Term" or "Putty".
Check our guide: <https://premiumpsu.com/wp-content/uploads/2025/09/Serial-Connection-Guide.pdf>

Also it is possible to control and monitor the unit directly using the protocol showed in table:

Protocol configuration: ASCII code, 19200 bauds, parity none, 8 bits, 1bit stop
